EDUCATION

Cornell University

Ithaca, NY

Bachelor of Science in Computer Science, Minors in Operations Research and Applied Math

Expected Dec. 2027

- GPA: 3.7
- Relevant Coursework: Machine Learning, Algorithms, Linear Algebra, Data Science, Data Structures and Functional Programming, iOS App Development, Object-Oriented Programming and Data Structures, Multivariate Calculus, Computer System Organization and Programming, Differential Equations, Compilers, Operating Systems

EXPERIENCE

Amazon Web Services

Starting Aug. 2026

Incoming Software Development Engineer Intern

Seattle, WA

- Joining the Amazon GameLift Servers Experience team, which builds game server hosting infrastructure including the AWS Console, Server SDK, and matchmaking services

Cornell Custom Silicon Systems (C2S2)

Sep. 2025 – Present

Embedded Software Engineer

Ithaca, NY

- Designed and deployed an advanced neural network using TensorFlow Lite on a microcontroller to implement a secure two-factor authentication system using on-chip microphone and IMU sensor data
- Write firmware in C and C++ that runs directly on microcontrollers, integrating software and hardware and developing collaboratively with other subteams
- Use libraries such as TinyML to deploy lightweight neural networks directly on chip

Cornell Cybersecurity Club

Sep. 2024 – Present

Cybersecurity Software Engineer

Ithaca, NY

- Creating ethical hacking algorithms using C, Python, BASH, and Javascript
- Participating in Capture the Flags and practice hacking challenges both individually and within teams
- Attending workshops and lectures from employees and researchers for MITRE and MIT Lincoln Laboratories

PROJECTS

Financial Data Verifier Pipeline | *Python, FMP API, SEC EDGAR, LLM Evaluation*

May 2026 – June 2026

- Built a deterministic verification pipeline that cross-references AI agent financial outputs against FMP API and SEC EDGAR data using the SEC's 5% materiality threshold with intermediate bands at 0.1%, 0.5%, and 1%
- Classified data cells by complexity type (direct lookups, comparative, and derived metrics) and routed each to appropriate verification methods, rejecting an LLM-judge approach due to shared blind spots
- Discovered a model hallucination where JPM shares outstanding was reported 4x too high due to stock vs. flow aggregation error, and caught a bug in the SEC EDGAR client caused by fiscal-year period boundary mismatches

StockPuppet | *Python, Flask, React, TypeScript, TF-IDF, LLM APIs, Git*

Feb. 2026 – May 2026

- Built a stock research tool that matches natural language queries against approximately 3,500 companies using TF-IDF with cosine similarity and field-weighted scoring across ticker, name, sector, and description fields
- Integrated an LLM layer that suggests follow-up searches based on query history and generates explanations for why a stock was surfaced
- Implemented fuzzy matching via Levenshtein distance for ticker search to handle typos and partial inputs

In21 | *Swift, React Native, Firebase, Docker, Tailwind CSS, Git*

June 2025 – Present

- Co-founded a productivity application catered to teenagers and young adults interested in self-improvement
- Implementing an efficient backend for storing user contact information and relevant metrics from in-app activities and surveys, created a messaging system between users and an email verification / sending system
- Utilizing Figma to design the page flows, then directly implementing the front end and APIs using React Native

TECHNICAL SKILLS

Languages: Java, TypeScript, JavaScript, Python, C/C++, HTML/CSS, x86/RISCV Assembly Language, OCaml, Swift

Frameworks/Databases: React, Next.js, Node.js, Prisma, Firebase, Flask, JUnit, PostgreSQL, MongoDB

Developer Tools/Libraries: Git, Docker, VS Code, Visual Studio, IntelliJ, pandas, NumPy, Matplotlib, Linux/Unix
